* Note that due to the small sample sizes, results for these regions should be interpreted with caution

Methodology:

This survey was conducted using High Definition Interactive Voice Response (HD-IVR™) technology, which allows respondents to enter their preferences by punching the keypad on their phone, rather than telling them to an operator. In an effort to reduce the coverage bias of landline only RDD, we created a dual landline/cell phone RDD sampling frame for this research. As a result, we are able to reach those with a landline and cell phone, as well as cell phone only households and landline only households.

The field dates for this survey are August 20-22, 2019. In total, a random sample of 1,182 Canadian adults aged 18 and over responded to the survey. The margin of error associated with the total sample is +/- 2.9 percentage points, 19 times out of 20.

Please note that the margin of error increases when the results are sub-divided (i.e., error margins for sub-groups such as region, sex, age, education). All the data have been statistically weighted by **age, gender, and region** to ensure the sample's composition reflects that of the actual population of Canada according to Census data.
